Project overview

CEERIES is a Filipino lifestyle and beauty brand. This student-created website demonstrates how the Hydra Slay Lip Oil collection can be presented as a connected digital marketing experience: brand storytelling, product browsing, gallery, campaign, email marketing preview, and a sample shopping workflow.

Scope note: This build is a classroom demonstration. Checkout, wallet, contact and newsletter entries are simulated or locally stored; no payment or real email delivery occurs.

Website structure and marketing strategy

Section	Purpose / notable functions
Home	Brand introduction, featured products, testimonials, embedded video preview, shade guide, FAQ and newsletter.
The formula	Dedicated product features, descriptions and calls to action.
Lip oils	Seven product listings; search by shade, filter, sort and open individual detail pages.
The edit	Model gallery with horizontal controls, enlarged viewer and keyboard navigation.
Contact / Account / My orders	Inquiries, demo profile preferences and local order records.
Social / Email campaigns	#MyCeeriesEdit campaign previews with a consistent product CTA.
API data demo	Visible GET responses for products and fictional customer dataset.

Campaign concept

Name: #MyCeeriesEdit **Message:** A little gloss. A lot of you.

Goal: Introduce seven Hydra Slay shades and encourage visitors to find a shade and explore its product page. **Audience:** Philippine consumers interested in affordable everyday beauty. **Channels:** Website announcement and campaign page, social media mockup, and matching email-marketing visualization.

Email marketing preview

Subject: A little gloss. A lot of you. - Meet Hydra Slay. **CTA:** Shop the collection. The email image and social campaign use the same products and marketing concept; email sending is intentionally not required or enabled.

Product details

QUEEN (Dark Red), HOT (Red), DIVA (Orange), ICON (Brown), BARBIE (Pink), PURR (Soft Nude), GORG (Clear). Price shown in the student product dataset: PHP 199.00 each.

Website screenshots - functional build

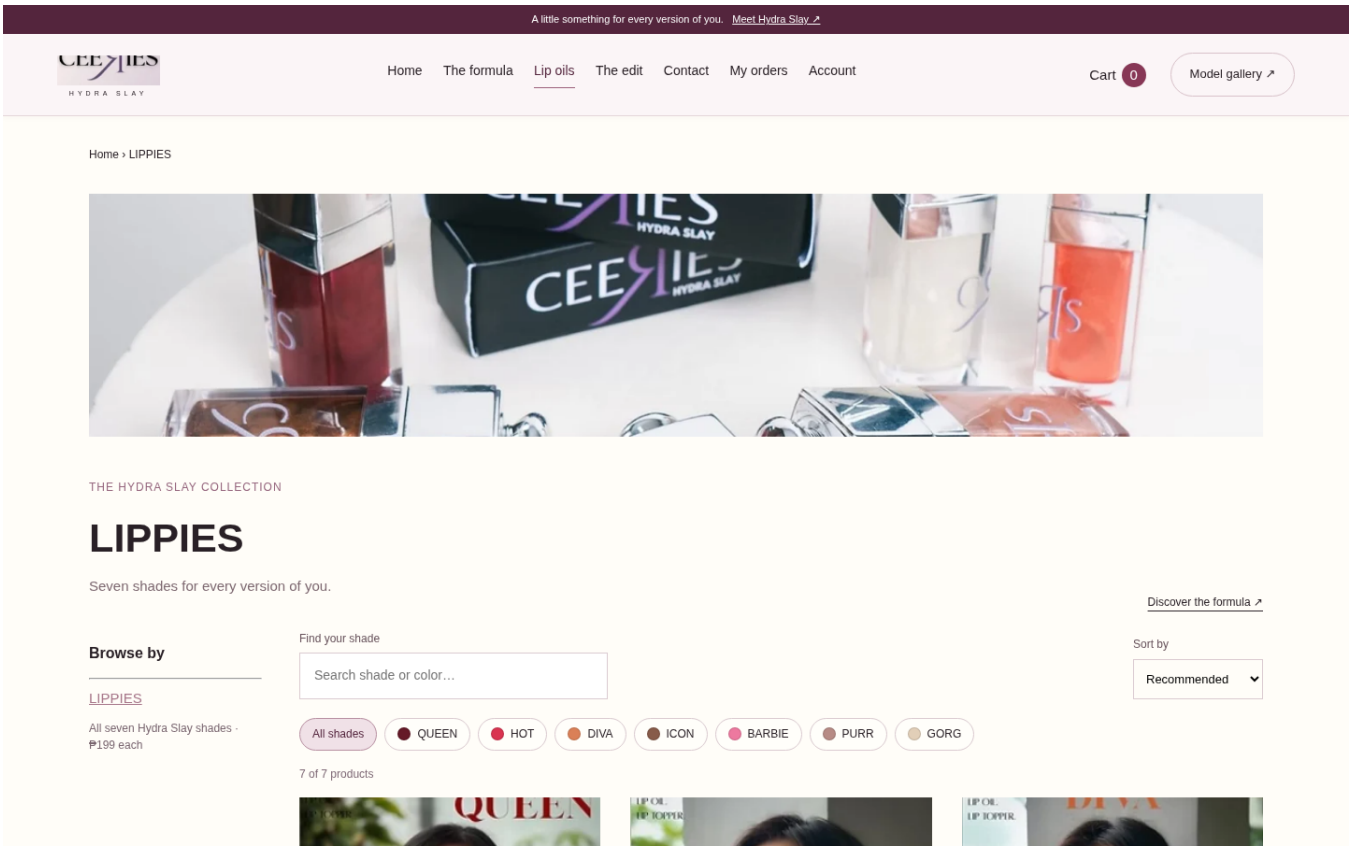

Figure 2. Shop collection screen: search, sorting, shade chips, and product grid.

Responsive display

The mobile layout preserves the brand colors and sections while adapting navigation and shop controls. Product cards and galleries are responsive; desktop and mobile smoke tests reported no horizontal page overflow.

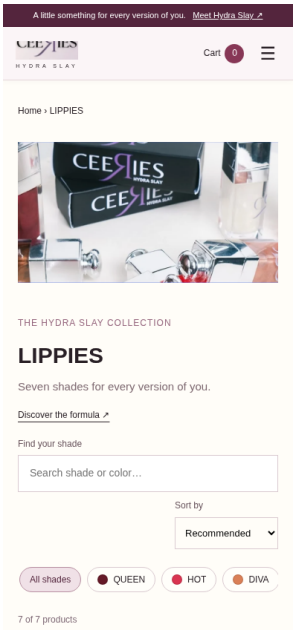

Figure 3. Mobile shop header and filters.

Technical integration and test summary

The source code consists of HTML, CSS, JavaScript and a built-in Node.js HTTP server. Product records are retrieved through GET /api/products, and fictional sample customer records through GET /api/customers. The website includes a rendered API demonstration at /#/api.

API operation	Returned data
GET /api/products	Seven lip oils: ID, name, shade, price, category, image, availability.
GET /api/customers	Three fictional student-demo records only. Real personal information is not included.
POST /api/orders	Records a demonstration order after contact and item validation; does not accept payment.
POST /api/contact	Stores a demo contact inquiry locally; does not send real email.
POST /api/subscribe	Records a fictional/demo subscription opt-in locally; does not send newsletters.

Tested interactions

Browser smoke tests passed for every header destination; shade searching, shade filtering, product sorting, detail swatches, cart quantity controls, checkout, order-history display, gallery lightbox, account address and wallet-demo preferences, contact submission, and both GET dataset displays. Tests were performed using local Node API responses and a headless Chromium browser.

Important implementation limitations

No real authentication, card processing, order delivery tracking, publishing of social advertisements, or outgoing email delivery is part of this demonstration. Public access to order data is disabled; orders are viewed in the browser where they were placed. Replace all provisional assets and add verified business contact/social links before publication.

Group member contributions and submission

*Complete this table with the **actual** group members and responsibilities. These are intentionally left blank rather than inventing contributions.*

Member name	Actual role / pages / assets completed
[Member 1]	[Specify contributions]
[Member 2]	[Specify contributions]
[Member 3]	[Specify contributions]
[Member 4]	[Specify contributions]

Instructor comments addressed

[Add the exact preliminary/instructor comments and a short description of what was corrected.]

Final submission links

Hosted website: [ADD VERIFIED URL]

Public GitHub repository: [ADD VERIFIED URL]

Required finalization before submission

1. Replace cropped photos, sample logo, and placeholder product video with original design media.
2. Supply official contact and social media details.
3. Confirm all group contributions and instructor feedback.
4. Replace provisional screenshots with final hosted-site captures.
5. Check and insert the working hosted and GitHub links.

This PDF is a documentation DRAFT, not a claim that hosting or live payments are complete.
